

Atomizer Wheel Made from Aircraft Grade Titanium Offers Superior Performance

RPM Solutions now manufactures and stocks titanium structural components for its 350mm Atomizer Wheel. The upgrade to titanium offers superior corrosion resistance over stainless steel. RPM's first stainless steel to titanium full conversion was in 1999 outlasting the replaced stainless steel components with 10 times longer life. Although the initial cost of converting to titanium structural components is greater than standard stainless steel, the overall cost of ownership of the titanium components is far less.

3-Piece Nozzle Design with Hardened Cup

Hardened upper cup significantly reduces the wear of the cup and case on the inside of the wheel.

NEW! "Long" Cone Nut Design Greatly Reduces Wear

Cone nut design provides smooth flow of slurry into the wheel.

Ceramic Upper Wear Ring and Patented Lid Design

Ceramic wear ring lasts many times longer than traditional metallic rings. Patented lid design preserves structural components of the wheel.
